

1. LIS

2. Russian doll envelope

3. Palindromic substrings

4. Palindrome partitioning.

Variations of LIS on [geeksforgeeks](https://www.geeksforgeeks.org/).

Q1: Given  $ar[N]$ , find the length of longest strictly increasing subsequence (LIS)

ex1:  $ar[5] : \begin{matrix} 0 & 1 & 2 & 3 & 4 \\ [9 & 2 & 4 & 3 & 10] \end{matrix}$

$[9] [9 \ 10] [2] [2 \ 4] [2 \ 4 \ 10] [2 \ 3 \ 10] [2 \ 10]$

$[4 \ 10] [3 \ 10]$

$\Rightarrow ans = 3$

ex2:  $ar[6] : \begin{matrix} 0 & 1 & 2 & 3 & 4 & 5 \\ [2 & 1 & 6 & 3 & 7 & 9] \end{matrix}$

$\Rightarrow ans = 4.$

Idea1: Generate all subsequences,  $O(2^N * N)$

Idea2: Pick or not pick.

Idea3:

$dp[i]$ : LIS ending at index 'i'.

$j: [0 \dots (i-1)]$        $i$

	0	1	2	3	4	5	6	7	8	9	10	11
$ar[i]$ :	10	3	12	7	2	9	11	20	11	13	6	8
$dp[i]$	1	1	2	2	1	3	4	5	4	5	2	3

+1

```
int dp[N]
```

```
dp[0]=1, ans=1
```

```
for (i=1; i<N; i++)
```

```
    maxAns=0
```

```
    for (j=0; j<i; j++)
```

```
        if (ar[j] < ar[i])
```

```
            maxAns = max(maxAns, dp[j])
```

```
    dp[i] = maxAns + 1
```

```
    ans = max(ans, dp[i])
```

```
return ans
```

Tc:  $O(N^2)$

Sc:  $O(N)$

[Patience-sort algo.]  $\Rightarrow$  TO-DO.

Binary search

Tc:  $O(N \log N)$

## 20. Russian doll envelope

You've  $N$ -different envelopes, find max count of envelopes that can be put in a single envelope.

Note: Rotation of envelope is not allowed.

	h	w
A →	5	6
B →	6	4
C →	6	7
D →	4	3

ans: 3.

$$h_1 < h_2$$

$$\&\& w_1 < w_2$$

$h: [9 \quad 5 \quad 10 \quad 3 \quad 4 \quad 2]$   
 $w: [3 \quad 4 \quad 8 \quad 2 \quad 3 \quad 7]$

ans = 4

create a pair of envelopes()

↳ sort based on height

↳ read  $w[]$  from envelopes

& Apply LIS on  $w[]$ .

← SPOILER ALERT!

Let's say the envelopes can be represented as - .

$e_1$   $e_2$   $e_3$   $e_4$   $e_5$  — — —  $e_{10}$ .

Let's find LIS.

$\Rightarrow e_1$   $e_4$   $e_6$   $e_{10}$

$\Rightarrow e_1 < e_4 < e_6 < e_{10}$

$[e_1 < e_2] \Rightarrow$  can  $e_1$  fit inside  $e_2$ .

$\wedge$   $\wedge$   
 $h$   $w$   $h$   $w$

$$e_1 \cdot h < e_2 \cdot h$$

$$e_1 \cdot w < e_2 \cdot w$$

$h: [9 \ 5 \ 10 \ 3 \ 4 \ 2]$

$w: [3 \ 4 \ 8 \ 2 \ 3 \ 7]$

$\rightarrow$  sort on height

$h: [2 \ 3 \ 4 \ 5 \ 9 \ 10]$

$w: [7 \ 2 \ 3 \ 4 \ 3 \ 8]$

$\Rightarrow$  LIS on  $w[]$ .

## Some variations

1. Minimum no. of ele's to be deleted from the array to make it sorted.

ex: [1 2 -5 6 -4 10 8 11]  
LIS: [1 2 6 10 11]

Ans:  $\text{len(arr)} - \text{LIS}$ .

2. Building the bridges.

s: [9 5 10 3 4 2]

e: [3 4 8 2 3 7]

[b<sub>1</sub> b<sub>2</sub> b<sub>3</sub> b<sub>4</sub> ... b<sub>10</sub>]  
LIS  $\Rightarrow$  [b<sub>1</sub> b<sub>3</sub> b<sub>6</sub> b<sub>10</sub>].

idea: Sort based on start/end & find the LIS of other array.

Q3: Check if every substring is a palindrome or not for a given string.

$S = "a b a c"$

a      b      a      c  
 a b      b a      a c  
a b a      b a c  
 a b a c

		a	b	a	c
		0	1	2	3
a	0	T	F	T	F
b	1		T	F	F
a	2			T	F
c	3				T

Idea: For each substring check if its palindrome or not.

$O(N^3)$

Idea:

(i)  $S[i] \neq S[j] \Rightarrow dp[i][j] = \text{false}$

(ii)  $S[i] == S[j] \Rightarrow dp[i][j] = dp[i+1][j-1]$

Start filling dp table from smallest subproblems.

Substring of length 1	Substring of length 2	Substring of length 3	Substring of length 4
(0,0)	(0,1)	(0,2) $\rightarrow dp[1][1]$	(0,3)
(1,1)	(1,2)	(1,3) $\rightarrow dp[2][2]$	(1,4) ✗
(2,2)	(2,3)	✗ (2,4) $\rightarrow dp[3][3]$	(2,5) ✗
(3,3)	(3,4) ✗	✗ (3,5) $\rightarrow dp[4][4]$	(3,6) ✗
true	$S[i] == S[j]$		

Gap between  $i$  &  $j$

$\Rightarrow 0, 1, 2 \dots N-1$

for (gap = 0; gap < N; gap++)

	0	1	2	3
0	T	F	T	F
1		T	F	F
2			T	F
3				T

For the diagonals.

$i \rightarrow 0$  to  $N-1$

$j \rightarrow \text{gap}$  to  $N-1$

for ( $i=0$ ,  $j=\text{gap}$ ;  $j < N$ ;  $i++$ ,  $j++$ )

gap = 0  $\Rightarrow i=0, j=0, i=1, j=1, i=2, j=2, i=3, j=3$

gap = 1  $\Rightarrow i=0, j=1, i=1, j=2, i=2, j=3$

gap = 2  $\Rightarrow i=0, j=2, i=1, j=3$

gap = 3  $\Rightarrow i=0, j=3$

# code.

boolean dp[N][N]

for (gap = 0; gap < N; gap++)

for ( $i=0$ ,  $j=\text{gap}$ ;  $j < N$ ;  $i++$ ,  $j++$ )

// base cases.

①

if (gap == 0)

dp[i][j] = true

②

if (gap == 1)

if (s[i] == s[j])

dp[i][j] = true

else

dp[i][j] = false

else

if ( $s[i] \neq s[j]$ )

$dp[i][j] = \text{false}$

else

$dp[i][j] = dp[i+1][j-1]$

return dp.

Variations:

1. count of all palindromic substrings: Total 1's in  $dp[][]$
2. length of longest palindromic substring:

$\text{maxGap} \Rightarrow \text{max gap in } dp[][] \text{ where } dp[i][j] = \text{true}.$

ans:  $\text{maxGap} + 1$

Q4. Find min no. of cuts required to partition the string into palindromes.

①  $x x \{ y$   
ans=1

②  $x \{ a \{ b a a b \} p$   
ans=3

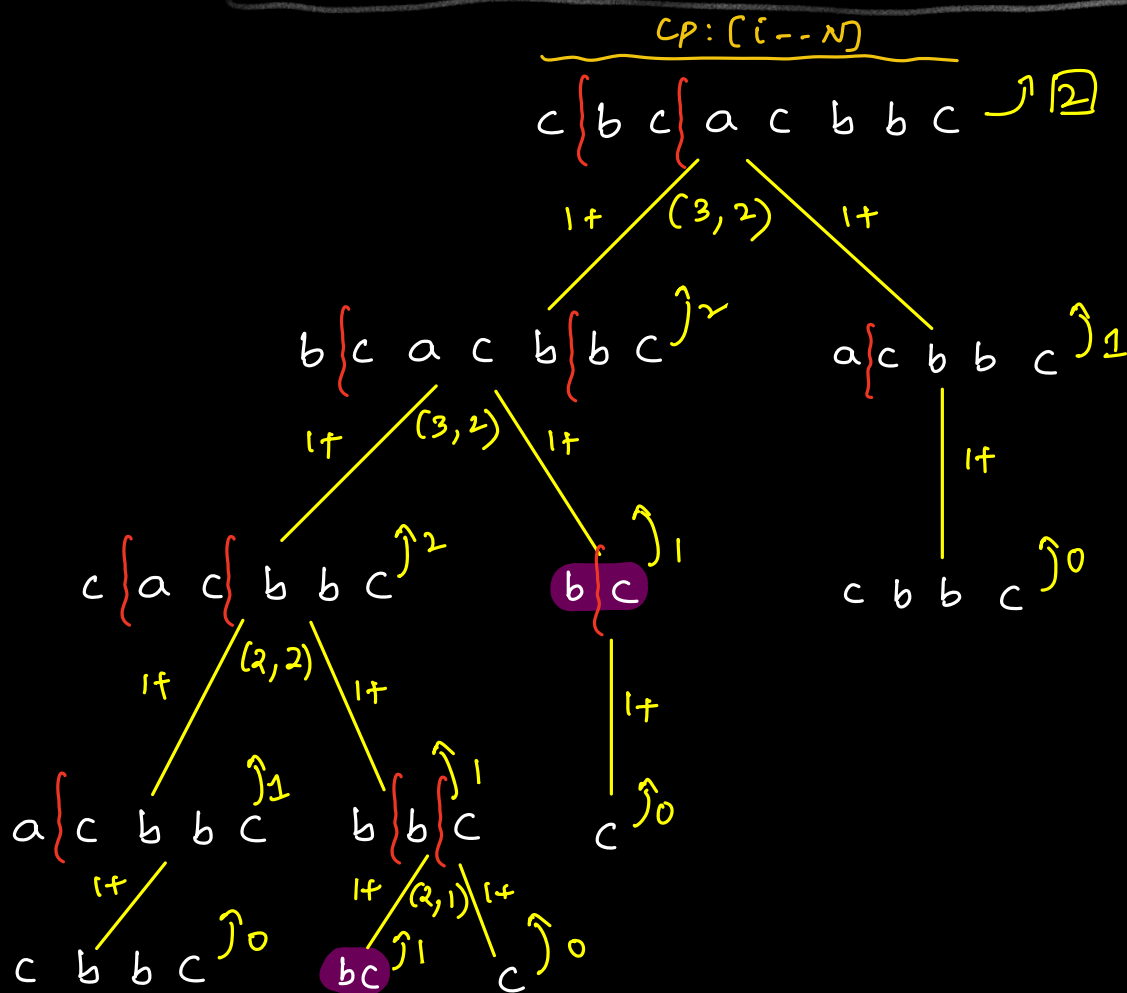

③  $a b b a \{ c$   
ans=1

④  $a \{ b b \{ c b c$   
ans=2

Greedy: Select longest palindromic substring. ✗

$c \{ b c a c b \} b \{ c \Rightarrow ans=3 [x]$

$c b c \{ a \{ c b b c \Rightarrow ans=2$

```

int minCuts(String str, int i, int N)
{
    if (checkPalindrome(str, i, N))
        return 0

    cuts = ∞
    for (int cp = i ; cp < N ; cp++)
        if (checkPalindrome(str, i, cp))
            cuts = min(minCuts(str, cp+1, N), cuts)

    return 1 + cuts
}

```

DP:  $dp[i]$ : min no. of cuts req. to cut the substring (0-i) into palindromes.

TC: (No. of states)(TC for each exp<sup>n</sup>).

$$O(N) * (N) \Rightarrow O(N^2).$$

↓ we can pre-populate isPalindrome  $\forall$  (0-i's)

SC: No. of states

$$O(N)$$

multiple sol's.
